SUMMARY

DevOps Engineer at CloudKeeper with a core strength in cloud cost optimization and FinOps automation on Microsoft Azure. Architected a multi-service recommendation platform and a change-detection engine that together delivered a **verified 12% reduction in client monthly cloud spend**. Skilled in containerization, CI/CD, and multi-tenant systems across AWS and Azure, with hands-on backend experience (Go, Node.js, Python) that I am actively deepening.

WORK EXPERIENCE

CloudKeeper | *DevOps Engineer*

Jul 2026 - Present | Noida, India

Azure FinOps Platform, Kubernetes Deployment & Cloud Migration

- Architected a multi-service **Azure FinOps recommendation platform** that orchestrates 16 cost-optimization engines into a single combined report, with all-or-nothing execution, per-subscription completeness auditing, and atomic output.
- Containerized and deployed the platform (built by my team and me) on **Azure Kubernetes Service (AKS)**, managing rollouts, scaling, secrets, and in-cluster networking.
- Led the **migration of our internal tuner and cost-reporting workloads from AWS to Azure**, re-platforming compute, storage, and CI/CD to run natively in our Azure tenant.
- Set up **monitoring and alerting** for resources provisioned across our Azure tenant, giving the team visibility into workload health, scan-pipeline status, and resource usage.
- Built a **Change Detection Engine** that verifies which recommendations clients actually implemented (the confirmed, billable set) using read-only targeted resource probes instead of costly re-scans, **confirming a realized 12% reduction in the client's monthly cloud spend**; scaled it to a multi-customer model with per-tenant service-principal auth.
- Designed the **cross-team engine-integration contract** (output schema, strict-failure and completeness semantics) and built adapter bridges that plugged two other engineers' engine suites into the pipeline with zero changes to their scan logic.
- Built cleaner and right-sizing, modernization recommendation engines across App Service, Load Balancer, SQL/SQL-MI, Redis, snapshots, backups, disks, VMs, and networking (NAT gateway, IP, private endpoints), with resource-lock, protect-tag, and slot/autoscale-aware delete-safety guards.

CloudKeeper | *DevOps Trainee*

Jan 2026 - Jul 2026 | Noida, India

- Conducted a cloud cost optimization analysis on a client's Azure infrastructure, identifying right-sizing and reserved-instance opportunities to reduce monthly cloud spend.
- Built **CloudPulse**, an AI-powered incident intelligence platform ingesting alerts from AWS and GCP, correlating them into incidents and generating LLM-based root cause analysis.
- Designed a multi-tenant backend in Go (Gin) with PostgreSQL, Redis, and JWT auth, supporting real-time incident processing and WebSocket streaming.
- Implemented incident correlation using time-window grouping and service-level deduplication to reduce alert noise; integrated **pgvector** similarity search to retrieve similar past incidents for faster debugging.
- Built event-driven ingestion pipelines with background workers, and set up CI/CD with GitHub Actions, structured logging, graceful shutdown, and containerized deployment on AWS ECS (IAM, VPC, EC2, ElastiCache).

- Built a cross-platform restaurant food-ordering app for a Norway-based client using **React Native (Expo Router)** and **Zustand** state management, covering menu browsing, search and filter, cart, order placement, order history, favorites, and profile management.
- Implemented a complete authentication flow with **JWT** login/register, **bcrypt** password hashing, email **OTP verification**, and password reset (nodemailer and mailgen), persisting tokens via AsyncStorage.
- Built the **Node.js/Express and MongoDB (Mongoose)** REST API (menu, orders, cart, user, and uploads) with express-validator and **Cloudinary + Multer** image uploads.
- Built a **React admin dashboard** for the restaurant to view and manage orders, menu items, and other operational details over the shared API.
- Redesigned and rebuilt two production websites, the **InstaDigii company site** and the **restaurant’s customer-facing site**, delivering modern, fully responsive UIs.

- Engineered a distributed personal cloud storage system using modern cloud architecture.
- Deployed Docker-containerized applications on AWS EC2 with automated CI/CD pipelines; built a cloud-based file conversion service with multi-region deployment and load balancing.
- Developed an AWS Lambda function provisioned via CloudFormation (function config, IAM roles, triggers as code) to automatically collect and transmit client usage data to the platform.

- Built and deployed a scalable blog platform using Hono and Cloudflare Workers.
- Developed a full-stack e-commerce application in Node.js with payment integration and admin dashboard.
- Applied clean architecture principles and collaborated to deliver production-grade features.

TECHNICAL SKILLS

Frontend	React.js, Next.js, JavaScript, TypeScript, Tailwind CSS, DaisyUI, Framer Motion, Vite
Mobile	React Native, Expo, Expo Router, Zustand
Backend	Node.js, Go (Gin), Python, Express.js, Spring Boot, PayloadCMS, RESTful APIs, WebSockets, Microservices
Databases	PostgreSQL, MySQL, SQLite, MongoDB, Redis, pgvector, Appwrite
Cloud & FinOps	Azure (AKS, Resource Graph, Cost Management API, Monitor, Blob Storage), AWS (ECS, EC2, IAM, VPC, Lambda, S3), cloud cost optimization, cloud migration
DevOps & Tools	Docker, AKS, Docker Compose, GitHub Actions, Jenkins, GitLab CI/CD, CloudFormation, RabbitMQ, monitoring & alerting, CVE scanning, Git
Soft Skills	Collaboration, Problem-solving, Communication, Time management, Adaptability

EDUCATION

Model Institute of Engineering and Technology	2024 - 2026
Master of Computer Applications (MCA), Computer Science	Jammu, India
Lovely Professional University	2021 - 2024
B.Sc. (Hons) Computer Science	Punjab, India
